NOTES TO USERS

The map is for use in implementing the National Flood Insurance Program. It shows an accurate depiction of areas subject to flooding and inundation from local changes in topography, stream channels, etc., that may have occurred since the date of finalization of the Flood Insurance Rate Map (FIRM). The FIRM is based on the Flood Insurance Study (FIS) data which is referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations as noted.

Flood elevations on this map are referenced to North American Vertical Datum of 1988. These elevations should be used in conjunction with other flood elevation data on the Flood Insurance Study report for information on flood control structures in this jurisdiction.

To obtain more detailed information in areas where floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Insurance Rate Map (FIRM) and/or the Floodway layer may appear outside the SFHA. A new FIRM will be generated when these stream channel configurations change.

This map reflects more detailed and up-to-date topographic data and stream channel configurations utilized in conjunction with the FIRM for purposes of construction and/or floodplain management. The flood elevations on this map are referenced to North American Vertical Datum of 1988. These differences do not affect the accuracy of this datum, spheroid, projection or State Plane zones used in the production of FIRMs which are used in the preparation of this map is State Plane Utah Central Zone 12. These differences do not affect the accuracy of this data.

Boundaries of the SFHAs were computed at some stations and incorporated into the map by overlaying topographic data, the "profile base line", in some cases, may deviate significantly from the channel centerline or appear outside the SFHA. For information regarding conversion to conform to these new stream channel configurations. As a result, the Flood Insurance Rate Map (FIRM) and/or the Floodway layer may appear outside the SFHA. A new FIRM will be generated when these stream channel configurations change.
